

Using an Adaptation of The Game Of Life To Measure Crowd Throughput

A FINAL YEAR PRESENTATION SUBMITTED IN PARTIAL FULFILMENT OF THE DEGREE:
BSC (HONOUR'S) COMPUTER GAMES TECHNOLOGY

BY

AIMS AND OBJECTIVES

AIM:

***TO INVESTIGATE OVERCROWDING USING THE
GAME OF LIFE AND DEPICT THE RESULTS WITH
COUPLED MAP LATTICES.***

OBJECTIVES:

- Implement a working version of the Game of Life;
 - Allow the Game to use an infinite plain and account for non-touching neighbours;
 - Gather data which shows the relationship between overcrowding and overall movement speed;
 - Research coupled map lattices and depict data graphically through use of them.
-

PROJECT BACKGROUND

GAME OF LIFE

- Runs on cellular automata
 - Grid of cells with two states.
 - Runs on its own from the rules set out at the beginning.
- Alive neighbours in this generation dictate its state in the next generation.
 - Alive and 2/3 alive neighbours -> Alive.
 - Dead and 3 neighbours -> Alive
 - Else -> Dead.

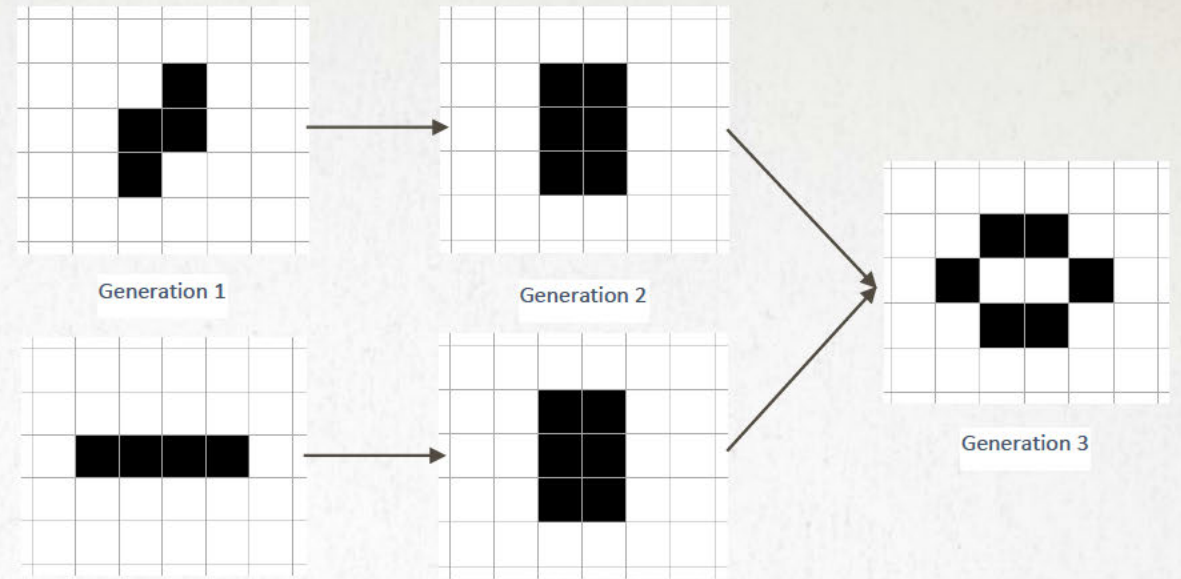

$$(2r + 1)^2 - 1$$

PROJECT BACKGROUND

PRACTICAL APPLICATIONS

- Encryption
- Computations

IMPLEMENTATION

FIRST ITERATION:

- Console application
- Dynamic grid sizes.
- Notable preset cell arrangements
- User feedback:
 - Generation count.
 - Alive cell count.

```
How many rows should the grid have?
8
How many columns should the grid have?
12

Generation 1
#_#_####_###
###_#####__
###_#_####
#_##_####_
#_#
#_#_#_###
####_#_###
##_###_#_#

Press Enter to contiune to the next generation or 'exit' to quit.

Generation 2
#_#_#___##_
_____#
#_###_#_#_#
#_#_#_#_#
#_#_#_#_#
#_#
#_#####_#

Press Enter to contiune to the next generation or 'exit' to quit.
```

IMPLEMENTATION

SECOND ITERATION:

- Cell class draws squares:
 - Black filled square for Alive cells.
 - Grey outline for Dead cells.
- Toggle for displaying cell data.
- User interface with buttons for controlling functionality.

```
public void Draw(Graphics graphics)
{
    if(Alive)
        graphics.FillRectangle(BlackBrush, x, y, width, height);
    else
        graphics.DrawRectangle(GrayPen, x, y, width, height);
}
```

D 0 → D	D 0 → D	D 1 → D	D 1 → D	D 1 → D
D 1 → D	D 1 → D	D 3 → A	A 1 → D	D 2 → D
D 1 → D	A 1 → D	D 5 → D	A 3 → A	D 3 → A
D 1 → D	D 2 → D	A 3 → A	A 2 → A	D 2 → D
D 0 → D	D 1 → D	D 2 → D	D 2 → D	D 1 → D

IMPLEMENTATION

EXTRA FEATURES:

- Game working on an infinite plain
- Ability to search for neighbours further away those that are touching.

[illegible]

COUPLED MAP LATTICES

AIM: Research coupled map lattices and depict data graphically through use of them.

- Shows dynamic systems better.
 - Ideal for Game of Life which changes over time.
 - Will be used to show crowd movement data.
-

COUPLED MAP LATTICES

EXAMPLE 1:

COUPLED MAP LATTICES

EXAMPLE 2:

EXPERIMENTATION

ROOMS

- Room filled with a crowd.
- Each cell contains directions pointing to the exit.
- Cell can only move for if it's not overcrowded.
- Same experiment run with different search ranges.
 - Recorded generations taken for humans to leave

RESULTS ANALYSIS

- First human always took the same
- Coupled map lattices highlight areas where build up or slow movement occurred.
 - Usually at the start or at conjoining paths.

EVALUATION

SUCSESSES:

- Game of Life implementation.
 - Many features: debug, alternate rules, dynamic grid sizes, user feedback etc.
- Infinite plain by joining edges.
- Coupled map lattice option.
- Search over range functionality.

LIMITATIONS:

- Game of Life differs greatly from crowd movements.
 - Game of Life cells act independently.
 - A move in diagonal is worth double.
- The cell that is searched first is at an advantage to move away first.

FURTHER DEVELOPMENT

- More tests with different starting arrangements.
 - Options to move vertically or horizontally if a diagonal move is unavailable.
 - Options to support multiple routes and exits.
 - Made using an application type that had better graphical performance.
-

PRODUCT DEMONSTRATION
